

FOR IMMEDIATE RELEASE

POWERSEARCH SOFTWARE LAUNCHES VERSION 3.0 AT ILTA 2011 CONFERENCE

New features include collection from Microsoft Exchange servers and more granular searching across document and email metadata

NASHVILLE, Tennessee – August 23, 2011 – PowerSearch Software, the leading developer of affordable and accessible search technologies, today announced the general availability of the latest release of its software, version 3.0. With this latest release, PowerSearch brings increased breadth and depth to the original product which was introduced to the market in May of this year. PowerSearch can be seen at the ILTA Conference at Booth 806, or can be [downloaded from the PowerSearch website](#).

“We have worked quickly to deliver features that will expand the appeal and usefulness of PowerSearch to large corporations, law firms, and government agencies while retaining our unique pricing structure which makes PowerSearch affordable for firms of all sizes,” said Girts Jansons, founder and CEO of PowerSearch.

“As always, PowerSearch 3.0 is free to download and deploy. Many people ask us, “What’s the catch?” about our pricing model. There is no catch. We are delighted to offer a product that helps companies to determine early and quickly what documents are relevant for the matters they are considering litigating. By having this information without cost, and only paying fractions of a cent for each file ultimately determined to be relevant, we believe that firms will be able to litigate more, and settle or abandon less.”

New features in PowerSearch 3.0 enable users to:

Collect from Microsoft Exchange Server

PowerSearch 3.0 allows users to point and click to index and search custodians and data directly from Microsoft Exchange servers. With no need to export custodian accounts to pst files, there are fewer steps during the identification and collection stages. Quicker results save substantial time and money.

Search on basic and extended document metadata

With PowerSearch 3.0 users can find documents by custodian, date range, and other system-level attributes as well as by metadata garnered from more than 40 fields internal to the documents themselves.

Search on email metadata

PowerSearch users can cluster relevant emails by custodian, date ranges, recipients and 17 other critical metadata tags that reside within emails. PowerSearch extracts email repositories and zipped files, indexing the content of emails and electronic documents making them fully searchable. Search results can be saved in folders and, if necessary, exported into other programs for further processing.

De-duplicate before export

PowerSearch 3.0 reduces the volume of documents to be exported, providing additional cost savings in time and export tokens. Unlike other collection and culling products, with

PowerSearch, there is no charge for deploying the software or for searching or culling. Users only pay for final results, files they ultimately deem relevant and decide to save, by using a system of tokens purchased online at a fraction of a cent per token. Fewer exports also mean cost savings later during review, commonly recognized to be the most expensive component of e-discovery.

Generate Downloadable Reports

PowerSearch 3.0 has six interactive reports that show users the status of all files. Users can click on file names within the reports to view or launch the native documents. The reports can also be downloaded.

About PowerSearch

PowerSearch Software is the leading developer of affordable and accessible search and collection technologies for the legal and records management industries. More information on PowerSearch, including the ability to download and deploy the product for free, is available at www.powersearchsoftware.com. The company is headquartered in Toronto, Canada.
